## 4. Brief description of the subject and syllabus

---

### 4.1. Brief description of the subject

In a broad sense, intelligent systems can be considered as a type of computer system that integrates artificial intelligence algorithms to solve problems in complex environments using limited resources. Intelligent systems are capable of acquiring and using knowledge by integrating methods based on machine learning, knowledge representation and reasoning.

This course presents AI techniques that are applicable to the design and construction of intelligent systems. The course starts with a general characterization of intelligent systems and an overview of the main approaches and basic concepts. Then, the course presents methods of artificial intelligence that can be used to develop different cognitive abilities of intelligent systems. These methods are presented following a formal theoretical approach together with practical exercises.

In particular, the course explains: (1) the foundations of neural networks, which have been used with great success, for example, in problems related to perception or classification, (2) how an intelligent system can learn to act using reinforcement learning techniques, (3) ontologies that are useful, for example, for symbolic knowledge representation and knowledge integration, and (4) natural language processing methods that are useful to facilitate the communication between systems and humans.

## 6.2. Assessment criteria

Partial and final grades are on the scale of 0 to 10. To pass the course it is required that the final grade G must be  $G \geq 5$ .

"Continuous" assessment and "final examination" are mutually exclusive. Students who want to follow "final examination" must inform the coordinator (martin.molina@upm.es) at the beginning of the course (in the first two weeks of the course). Otherwise, continuous assessment is followed.

Students who have chosen "continuous" assessment may be affected during the course by problems related to Covid-19 or by the need to enter working life due to the socio-economic situation. In this case, students can apply for admission to the "final examination". This request must be sent to the coordinator (martin.molina@upm.es) and duly justified with the appropriate documentation.

Students who follow "final examination" or "referred (re-sit) examination" must submit to the coordinator (martin.molina@upm.es) the practical projects at least one week before the day established for the written examination. The student will be allowed to take the written examination if the student has submitted in advance the practical projects.
