## 4. Brief description of the subject and syllabus

---

### 4.1. Brief description of the subject

In a broad sense, intelligent systems can be considered as a type of computer system that integrates artificial intelligence algorithms to solve problems in complex environments using limited resources. Intelligent systems are capable of acquiring and using knowledge by integrating methods based on machine learning, knowledge representation and reasoning.

This course starts with a general characterization of intelligent systems with an overview of the main approaches and basic concepts related to knowledge representation and reasoning. Then, the course presents AI methods that are applicable to the design and construction of intelligent systems.

The course describes the foundations of artificial neural networks, which have been used with great success, for example, in problems related to perception or classification. Next, the course presents methods for building ontologies that are useful, for example, for symbolic knowledge representation and knowledge integration. Finally, the course explains natural language processing methods that are useful to facilitate a more effective human-machine interaction.
