5. Brief description of the subject and syllabus

5.1. Brief description of the subject

Deep learning has emerged from the connectionist branch of machine learning, aided by the arrival of big data and increased computational power (e. g., parallelization using graphics processing units - GPUs). Deep learning has shown better performance than other approaches to solve problems that cope with large amounts of data as it is required, for example, in computer vision (image or video processing) or speech understanding.

This course presents a theoretical and practical view of deep learning. It is assumed that students are familiar with the basic foundations of neural networks (e.g., shallow artificial neural networks and backpropagation algorithm). The course describes general methods to train deep neural networks (e.g., optimization algorithms, regularization methods, normalization methods, etc.) and presents neural models for specific domains (e.g., computer vision and other application domains) together with software tools to train neural networks.

5.2. Syllabus

1. Training methods for deep neural networks
 - 1.1. Deep neural networks
 - 1.2. Training methods
2. Deep learning for computer vision
 - 2.1. Foundations of computer vision
 - 2.2. Convolutional neural networks
3. Other application domains
