Software description

This work is the first contemporary attempt to systematise the analysis and project process for collective housing into a complete data structure with a universal mission.

As there are regulated templates, it is possible to establish precise crossovers and analogies amongst all the buildings parametrised. The main interest centres on data, on the measurable, on what can be comparable from an objective point of view, so that, once analysed, compared and assimilated, it is possible to go from abstract research to applied research as a project tool.
