Software description

The program is an app for Android that is capable of bringing together several multimedia elements to create a video using them. To do so, it carries out the following functions: video capture at a set quality, in this case 320×240 resolution, 25fps frame rate and 1 Mbps bit rate; selecting multimedia elements on the mobile device; inserting texts onto selected images; cutting the video selected; interlinking several photos and videos; and superimposing an audio track over all the multimedia content generated.
